

MOCK INTERVIEW ASSESSMENT REPORT

Student Name: U.lakshikhaashri

Register Number: 1921260155

INTERVIEW QUESTIONS AND RESPONSES

Q1

Question Asked: What is DNS, and what is its main purpose in a computer network?

Student Response: DNS (Domain Name System) is a system used in computer networks to translate domain names into IP addresses.

Q2

Question Asked: What is the difference between SMTP and POP in electronic mail communication?

Student Response: SMTP stands for Simple Mail Transfer Protocol. It is used to send emails and transfers emails from the sender to the mail server and between mail servers. POP stands for Post Office Protocol. It is used to receive/download emails from the mail server to the user's device. SMTP is mainly used for outgoing mail, while POP is mainly used for incoming mail. Common ports are 25 and 587 for SMTP and 110 for POP3.

Q3

Question Asked: Imagine a user enters www.example.com in a web browser. Explain what happens at the DNS and HTTP levels before the webpage is displayed.

Student Response: DNS converts the domain name into the server's IP address. The browser uses the IP address to send an HTTP request to the web server. The server sends back the webpage data, and the browser processes the data and displays the webpage. In short: Domain Name → DNS → IP Address → HTTP Request → HTTP Response → Webpage.

Q4

Question Asked: What is P2P (Peer-to-Peer) communication, and how is it different from the traditional client-server model?

Student Response: P2P (Peer-to-Peer) is a network model where computers communicate directly with each other and can act as both clients and servers. P2P devices share resources directly with each other; there is no central server. In client-server, clients request services or data from a central server.

Q5

Question Asked: What is VoIP, and how does it transmit voice communication over a computer network?

Student Response: VoIP stands for Voice over Internet Protocol. It allows us to make voice calls over the Internet by converting voice into digital data packets and sending them through the network.

Q6

Question Asked: What is SSL, and how does it help protect data transmitted over a network?

Student Response: SSL stands for Secure Sockets Layer. It protects data transmitted over a network by encrypting the information, so unauthorized users cannot easily read or access it.

Q7

Question Asked: A company's network is receiving a very large number of requests, causing legitimate users to lose access to the service. What type of attack could this be, and what security mechanism could help protect the network?

Student Response: This could be a DoS or DDoS attack, where a large number of requests overload the network or server. A firewall, intrusion prevention system, or DDoS protection service can help detect and block the malicious traffic.

Q8

Question Asked: What is an Overlay Network, and give one example of where it can be used.

Student Response: An overlay network is a virtual network built on top of an existing physical network. It provides additional communication or routing features without changing the underlying network. One example is a VPN, which creates a virtual network over the Internet.

Q9

Question Asked: A user connects to a public Wi-Fi network and accesses a website containing sensitive information. What security mechanism would you recommend to protect the data, and why?

Student Response: I would recommend using HTTPS or a VPN. HTTPS encrypts the data between the user and the website, protecting sensitive information from being intercepted on public Wi-Fi.

Q10

Question Asked: A company wants to monitor the health and performance of its network devices, such as routers and switches. Which protocol would you use, and what information can it provide?

Student Response: I would use SNMP, which stands for Simple Network Management Protocol. It helps monitor routers and switches by providing information such as CPU usage, memory usage, bandwidth, traffic, and device status.

QUESTION-WISE EVALUATION TABLE

Question	Technical	Problem Solving	Analytical	Communication	Confidence	SubQ Total
Q1	Level 4	Level 3	Level 3	Level 4	Level 4	92.50
Q2	Level 4	Level 4	Level 4	Level 4	Level 4	100.00
Q3	Level 4	Level 4	Level 4	Level 4	Level 4	100.00
Q4	Level 4	Level 4	Level 4	Level 4	Level 4	100.00
Q5	Level 4	Level 3	Level 3	Level 4	Level 4	92.50
Q6	Level 4	Level 3	Level 3	Level 4	Level 4	92.50
Q7	Level 4	Level 4	Level 4	Level 4	Level 4	100.00
Q8	Level 4	Level 4	Level 4	Level 4	Level 4	100.00
Q9	Level 4	Level 4	Level 4	Level 4	Level 4	100.00
Q10	Level 4	Level 4	Level 4	Level 4	Level 4	100.00

RUBRIC EVALUATION

Criterion	Weightage	Assigned Level	Marks Awarded
Technical Knowledge	25	Level 4	25
Problem Solving	25	Level 4	25
Analytical Thinking	20	Level 4	20
Communication	15	Level 4	15
Confidence	15	Level 4	15
Total	100		100

SUMMARY

Criterion	Marks
Technical Knowledge (25)	25
Problem Solving (25)	25
Analytical Thinking (20)	20
Communication (15)	15
Confidence (15)	15
Final Rubric Score	100 / 100
Student Avg Final Mark	97.50 / 100

OVERALL FEEDBACK

Strengths

- Demonstrated strong understanding of Computer Networks fundamentals.
- Correctly explained DNS, SMTP, POP, HTTP, P2P, VoIP, SSL, DoS/DDoS, overlay networks, HTTPS, VPN, and SNMP.
- Gave strong scenario-based answers for DNS/HTTP, DoS/DDoS, and public Wi-Fi security.
- Used appropriate technical terminology and communicated answers clearly.

Areas for Improvement

- Expand answers slightly when explaining deeper technical mechanisms.
- Develop deeper understanding of certificates, authentication, and secure connections in SSL/HTTPS.
- Practice complete DNS and HTTP communication sequences and more scenario-based questions.

Interview Readiness: EXCELLENT
